

69405.4 Global Warming Potential

(a)

The global warming potential hazard trait is defined as the propensity for a chemical substance to be a greenhouse gas, that is, to absorb infrared radiation in the atmosphere and, thereby, contribute to the general warming of the planet.

(b)

Evidence for the global warming hazard trait includes but is not limited to: measures of the global warming potential which meet the criteria of the International Panel on Climate Change as a global warming substance.
