N2001. Drug Regimen Review - Complete only if A0310B = 01

Enter Code

☐

Did a complete drug regimen review identify potential clinically significant medication issues?

- 0. **No** - No issues found during review
- 1. **Yes** - Issues found during review
- 9. **NA** - Resident is not taking any medications

Item Rationale

Health-related Quality of Life

- Potential and actual resident medication adverse consequences and errors are prevalent in health care settings and often occur during transitions in care.
- Adverse consequences related to medications may result in serious harm or death, emergency department visits, and rehospitalizations and affect the resident's health, safety, and quality of life.
- Drug regimen review is intended to improve resident safety by identifying and addressing potential and actual clinically significant medication issues at the time of a resident's admission (start of SNF PPS stay) and throughout the resident's stay (through Part A PPS discharge).

Planning for Care

- Drug regimen review is an important component of the overall management and monitoring of a resident's medication regimen.
- Prevention and timely identification of potential and actual medication-related adverse consequences reduces the resident's risk for harm and improves quality of life.
- Educate staff in proper medication administration techniques and adverse effects of medications, as well as to be observant for these adverse effects.
- Implement a system to ensure that each resident's medication usage is evaluated upon admission and on an ongoing basis and that risks and problems are identified and acted upon.

DEFINITION

DRUG REGIMEN REVIEW

A drug regimen review includes medication reconciliation, a review of all medications a resident is currently using, and a review of the drug regimen to identify, and if possible, prevent potential clinically significant medication adverse consequences. The drug regimen review includes all medications, prescribed and over the counter (OTC), nutritional supplements, vitamins, and homeopathic and herbal products, administered by any route. It also includes total parenteral nutrition (TPN) and oxygen.

N2001: Drug Regimen Review (cont.)

Steps for Assessment

1. Complete a drug regimen review upon admission (start of SNF PPS stay) or as close to the actual time of admission as possible to identify any potential or actual clinically significant medication issues.
2. Review medical record documentation to determine whether a drug regimen review was conducted upon admission (start of SNF PPS stay), or as close to the actual time of admission as possible, to identify any potential or actual clinically significant medication issues.

Medical record sources include medical records received from facilities where the resident received health care, the resident's most recent history and physical, transfer documents, discharge summaries, medication lists/records, clinical progress notes, and other resources as available.

3. Discussions (including with the acute care hospital, other staff and clinicians responsible for completing the drug regimen review, the resident, and the resident's family/significant other) may supplement and/or clarify the information gleaned from the resident's medical records.
4. Clinically significant medication issues may include, but are not limited to:
 - Medication prescribed despite documented medication allergy or prior adverse reaction.
 - Excessive or inadequate dose.
 - Adverse reactions to medication.
 - Ineffective drug therapy.
 - Drug interactions (serious drug-drug, drug-food, and drug-disease interactions).
 - Duplicate therapy (for example, generic-name and brand-name equivalent drugs are *both* prescribed).
 - Wrong resident, drug, dose, route, and time errors.
 - Medication dose, frequency, route, or duration not consistent with resident's condition, manufacturer's instructions, or applicable standards of practice.
 - Use of a medication without evidence of adequate indication for use.
 - Presence of a medical condition that may warrant medication therapy (e.g., a resident with primary hypertension does not have an antihypertensive medication prescribed).
 - Omissions (medications missing from a prescribed regimen).
 - Nonadherence (purposeful or accidental).

Coding Instructions

- **Code 0, No:** if no clinically significant medication issues were identified during the drug regimen review.
- **Code 1, Yes:** if one or more clinically significant medication issues were identified during the drug regimen review.
- **Code 9, NA:** if the resident was not taking any medications at the time of the drug regimen review.

Coding Tips

- A dash (–) value is a valid response for this item; however, CMS expects dash use to be a rare occurrence.
- The drug regimen review includes all medications, prescribed and over the counter (OTC), including nutritional supplements, vitamins, and homeopathic and herbal products, administered by any route. The drug regimen review also includes total parenteral nutrition (TPN) and oxygen.
- *Adverse drug reaction (ADR) is a form of adverse consequence. It may be either a secondary effect of a medication that is usually undesirable and different from the therapeutic effect of the medication or any response to a medication that is noxious and unintended and occurs in doses for prophylaxis, diagnosis, or treatment. The term “side effect” is often used interchangeably with ADR; however, side effects are but one of five ADR categories, the others being hypersensitivity, idiosyncratic response, toxic reactions, and adverse medication interactions. A side effect is an expected, well-known reaction that occurs with a predictable frequency and may or may not constitute an adverse consequence.*

DEFINITIONS

POTENTIAL OR ACTUAL CLINICALLY SIGNIFICANT MEDICATION ISSUE

A clinically significant medication issue is a potential or actual issue that, in the clinician's professional judgment, warrants physician (or physician-designee) communication and completion of prescribed/recommended actions by midnight of the next calendar day at the latest.

“Clinically significant” means effects, results, or consequences that materially affect or are likely to affect an individual's mental, physical, or psychosocial well-being, either positively, by preventing a condition or reducing a risk, or negatively, by exacerbating, causing, or contributing to a symptom, illness, or decline in status.

Any circumstance that does not require this immediate attention is not considered a potential or actual clinically significant medication issue for the purpose of the drug regimen review items.

N2001: Drug Regimen Review (cont.)

Examples

1. The admitting nurse reviewed and compared the acute care hospital discharge medication orders and the physician's admission medication orders for *Resident D*. The nurse interviewed *Resident D*, who confirmed the medications *they were* taking for *their* current medical conditions. The nurse found no discrepancies between the acute care hospital discharge medications and the admitting physician's medication orders. After the nurse contacted the pharmacy to request the medication, the pharmacist reviewed and confirmed the medication orders as appropriate for *Resident D*. As a result of this collected and communicated information, the nurse determined that there were no potential or actual clinically significant medication issues.

Coding: N2001 would be coded **0, No**—No issues found during review.

Rationale: The admitting nurse reviewed and compared *Resident D*'s discharge medication records from the acute care hospital with the physician's admission medication orders, collaborated with the pharmacist, and interviewed the resident. The nurse determined there were no potential or actual clinically significant medication issues.

2. *Resident H* was admitted to the nursing facility after undergoing cardiac surgery for mitral valve replacement. The acute care hospital discharge information indicated that *Resident H* had a mechanical mitral heart valve and was to continue receiving anticoagulant medication. While completing a review and comparison of *Resident H*'s discharge records from the hospital with the physician's admission medication orders and admission note, the nurse noted that the admitting physician had ordered *Resident H*'s anticoagulation medication to be held if the international normalized ratio (INR) was below 1.0, however, the physician's admission note indicated that the desired therapeutic INR parameters for *Resident H* was 2.5–3.5. The nurse questioned the INR level listed on the admitting physician's order, based on the therapeutic parameters of 2.5–3.5 documented in the physician's admission note, which prompted the nurse to call the physician immediately to address the issue.

Coding: N2001 would be coded **1, Yes**—Issues found during review.

Rationale: The admitting nurse reviewed and compared *Resident H*'s discharge health care records from the acute care hospital with the nursing facility physician's admission medication orders and admission note. The nurse identified a discrepancy between the physician's documented therapeutic INR level (2.5–3.5) for *Resident H* in the admission note and the physician's order to hold anticoagulation medication for an INR level of 1.0. The nurse considered this discrepancy to be a potential clinically significant medication issue that could lead to potential clotting issues for *Resident H*.
